# TECH-TALK EULLETN 

## Coatings and Sealants

This Tech-Talk is intended as a guide for the use and estimation of fluid applied coatings, membranes and sealants. The calculations contained herein are theoretical and generally do not take into account substrate condition or the experience of the applicator. Please adjust as your experience requires.

## Definitions

WFT Wet Film Thickness or the thickness as applied wet prior to any drying or shrinkage
DFT Dry Film Thickness or the thickness after the coating is fully cured.
Mil The most common Imperial unit of measure for coatings is equivalent to 1 thousandth of an inch which equals 25.4 microns or $25.4 \mu$.
Micron $\quad$ Metric unit of measure for coatings or thin films, also known as the Micrometre or $\mu$ which equals 0.001 mm or 0.000039 inch or 0.039 mil. Metric measurements in millimeters are more common for air barrier membranes.
LF A linear foot is a unit of length. It is commonly given in reference to a given width or other unit.
SBV Solids by Volume can be found on technical data sheets and will vary by product.
SBW
Solids by Weight requires conversion to SBV in order to be useful for these calculations.

Theoretical Coverage
$\mathrm{ft}^{2} /$ US gal $=\frac{\% \text { SBV } \times 1604}{\text { DFT (mils) }}$
or $\quad \mathrm{m}^{2} /$ liter $=\frac{\text { SBV } \times 1000}{\text { DFT (microns) }}$

## Practical Coverage

Theoretical Coverage - (Theoretical Coverage x \% Loss)

## Consumption

Area ( $\mathrm{ft}^{2}$ or $\mathrm{m}^{2}$ )
Practical Coverage (gallons or liters)
